

ERRATA — RB_R2.md rung-table lines (sine-omission defect; endpoint unaffected)

Date: 2026-09-13. Author of this note: lead coordinator, on the LPW_CONSTANT agent's finding (MANIFEST entry falsify.py 435b40ce..., receipted F1–F8 PASS).

The defect

RB's R2 rung script (RB_R2_part2_spectral.py) zeroes covariance entries with odd $|+|$ total derivative order. That is correct only at separation $t = 0$: for $t \neq 0$, pairs with odd x -order are nonzero SINE sums (the odd part of the spectral kernel is a sine series, not zero). The rung table (Γ_r at $r > 0$) therefore carries $O(r)$ entry errors — e.g., the $\text{Var}(U_6)$ -class entries are off at the $\sim 8/r$ -sensitivity class at small r , and the reported density of J at $r = 0.025$ was $1.2831682e-3$ versus the corrected $1.2832254e-3$ (the gap is exactly the omitted sine terms; the constant agent's corrected T_r route and profile route agree to $2.1e-56$ and reproduce every reference value).

Scope and impact

- UNAFFECTED (exact at the endpoint $r = 0$): the ten-jet covariance Γ_0 , its certified eigenfloor ($_min = 0.126553449667289$ as evidence; the proved floor 0.124 from the author-side supplement), the Schur complement $\text{diag}(2, 1/2, 1/2, 1/6)$ (planar reference; finite-torus moment forms per the reconciliation), the conditional mean $(-a\ b, 0, 0, 0)$, and every Q1–Q7 disposition of the qualitative review — the LPW endorsement (cf58f72e...) is untouched (its proof uses $r \rightarrow 0$ continuity and compactness, and the corrected density is slightly HIGHER, strengthening the density-floor evidence).
- AFFECTED (rung-dependent evidence lines in RB_R2.md §4–§5): the Γ_r rung table's $O(r)$ -order entries and the single-rung density display at $r = 0.025$ (corrected value $1.2832254e-3$). These were evidence displays, not proof inputs; the corrections change nothing in any disposition.
- The uniformity claims (continuity down to $r = 0$; the compactness argument for the density floor) are analytic and unaffected; the certified interval modulus of the LPW_CONSTANT agent ($\|\Gamma_r - \Gamma_0\|_F \leq 19.071156 \cdot R$ on $[0, 1e-5]$) is the radius certificate of record and is independent of RB's rung script.

Correction of record

RB_R2.md is a frozen report and is NOT edited. This note stands as the errata of record for its rung-table lines. Any future rung computation must use the full $\cos+\sin$ spectral form (the pattern of `verify_g9_periodized_transfer_v1.py`'s $kL/kE/kS$ machinery, or the constant agent's corrected T_r route).
