

INDEPENDENT PEER-REVIEW PACKET

EC-016

Retirement of Imported a_r and Continuum Jet-Box Certification Claims

Cold Review Packet 11 of 20

Dylan M. Roy Mathematical Research Program

Prepared for independent validation - 27 July 2026

This packet is self-contained for mathematical review. Drive access is supplemental, not required to understand the claim and proof.

READ FIRST

You are being asked to review one narrow terminal object, not the wider q0/P0.2/Theorem B research program. The declared terminal label is an internal research-state classification. Your task is to decide whether the exact statement and its proof/evidence are correct within the stated hypotheses and exclusions.

1. Pass A - Independent reconstruction. Read the exact statement, notation, and hypotheses. Attempt your own derivation or falsification before reading the embedded historical review record.
2. Pass B - Source audit. Compare your reconstruction with the complete controlling source text embedded in Part II. Check every dependency, sign, factor, quantifier, scope boundary, and computational claim.
3. Pass C - Hostile review. Run the object-specific focal checks and invent at least one additional mutation or counterexample attempt.
4. Issue one fail-closed verdict: APPROVE; APPROVE WITH CLARIFICATIONS; AMEND REQUIRED; REJECT; or CANNOT VERIFY.

Do not transfer approval to excluded downstream claims. Do not count access to this packet, the author, or another reviewer as independent mathematical evidence.

Part I - Exact Review Object

Packet	11 of 20
Object ID	EC-016
Object class	Terminal negative result / claim retirement
Exact statement	Retire the claims that CL-DATA-051 directly measures a_r, that a finite test set proves capture for every point of the nine-dimensional box, and that box-membership mass is certified capture mass. Preserve the finite-grid corridor and box-mass diagnostics.
Internal terminal label	KILLED - UNSUPPORTED DIRECT a_r AND CONTINUUM CERTIFICATION CLAIMS; DIAGNOSTICS RETAINED
Terminal date	2026-07-22
Recommended expertise	Statistical inference / numerical validation / scientific methodology

1. Significance

This object was separated from larger theorem claims so that its correctness can be assessed without accepting unrelated Gaussian-field, persistence, adjacency, or asymptotic assertions. A positive review supports only the exact statement above and the dependency uses explicitly listed below.

2. Evidence class and prior review

Evidence	Exact source audit, byte-exact capsule, 1,536 fail-closed vertex/rung passes, and independent source-level retirement review.
Prior review record	Outside review approved the exact retirement scope and the preservation boundary.
Binding exclusions	The underlying finite-grid and box-mass data are not invalidated; no claim is made that the target theorem is false.

3. Dependency map and use restrictions

- Inputs: only definitions, hypotheses, and subordinate identities explicitly reproduced in the controlling source text.
- Output: only the exact statement listed in the review-object table.
- Permitted downstream use: as a cited lemma/interface under identical object definitions and hypotheses.

- Forbidden transfer: no approval of a parent theorem, numerical constant, external release, or canonical promotion unless separately reviewed.
- Object-specific exclusions: The underlying finite-grid and box-mass data are not invalidated; no claim is made that the target theorem is false.

4. Object-specific hostile checks

- Identify the exact inferential leap from finite tests to continuum certification.
- Check whether the computation samples the target law defining a_r.
- Verify that the retained diagnostics are logically weaker and remain valid.
- Attempt at least one additional mutation that changes an orientation, sign, normalization, law, endpoint, or quantifier while leaving the text superficially similar.

5. Proof-obligation ledger

Obligation	Reviewer test	Initial state
O1 Object identity	Definitions, ordering, normalization, and law match the statement.	OPEN FOR REVIEW
O2 Hypotheses	Every hypothesis used is stated and no stronger premise is hidden.	OPEN FOR REVIEW
O3 Derivation	Each algebraic, analytic, topological, or probabilistic step is valid.	OPEN FOR REVIEW
O4 Quantifiers	Uniformity, existence, endpoint, and asymptotic quantifiers are correct.	OPEN FOR REVIEW
O5 Computation	Any executable or interval result is reproducible and non-vacuous.	OPEN FOR REVIEW
O6 Scope firewall	The conclusion is not silently enlarged beyond the exact object.	OPEN FOR REVIEW
O7 Contradictions	No known correction, counterexample, or retained caveat defeats the claim.	OPEN FOR REVIEW

Part II - Complete Controlling Source Text

The following is a paragraph-order-preserving text reproduction of the controlling Drive artifact. Typography is normalized for this packet; mathematical content is not intentionally rewritten. Use the manifest URL for native-file or byte-level checks.

TECHNICAL GATE UPDATE — 2026-07-22

C047R-AUD-002-v1.0 read the audited CL-DATA-051 source line by line, confirmed all five source/inference defects, verified that the retained finite-grid and box-mass diagnostics are preserved fairly, and filed APPROVE EC-016 EXACT RETIREMENT SCOPE. The frozen AO48/CW/C047R gate is therefore satisfied. EC-016 is now HUMAN-APPROVAL-READY and remains nonterminal until Dylan M. Roy explicitly states APPROVE EC-016 EXACT RETIREMENT SCOPE. No exact-field, uniform-r, P0.1, P0.2, Theorem B, machine, release, deletion, or destructive claim follows.

Review: https://docs.google.com/document/d/1JFhX-kdPZDTouZNaUdEsTgR3_88zht2n1r401CedWL0/edit

[[OBJ:C047R-AUD-002-v1.0]] [[QUEUE:EC-016]] [[STATUS:HUMAN-APPROVAL-READY]] [[STATUS:NOT-TERMINAL]]

GP-CLS-PROP-019-v1.0 — CONDITIONAL RETIREMENT OF IMPORTED a_r AND CONTINUUM JET-BOX CLAIMS

Artifact ID: GP-CLS-PROP-019-v1.0

Prepared by: GP — OpenAI GPT-5.6 Thinking

Created: 2026-07-22

Class: CLS-PROP — complete additive negative-result closure package

Authority: none until the stated outside-review and human-approval gates pass

Canonical impact: NONE before approval; afterward only the exact rejected claims below

Queue candidate: EC-016

[[OBJ:GP-CLS-PROP-019-v1.0]] [[OBJ:GP-AUD-103-v1.0]] [[OBJ:GP-DATA-104-v1.0]] [[QUEUE:EC-016]]
[[STATUS:CONDITIONAL-NEGATIVE-RESULT-CLOSURE]]

1. EXACT OBJECT PROPOSED FOR RETIREMENT

Retire only these five claims as unsupported by CL-DATA-051 and CL-AUD-051:

C1. CL-DATA-051 directly measures the three displayed adjacency probabilities a_r .

C2. The 72 tested points establish capture for every point of the declared nine-dimensional coordinate box B.

C3. The estimated coordinate-box membership mass $P_r^{\text{MS}}(B)$ is already a rigorous certified-capture lower bound for a_r .

C4. The executed sampler and dynamics justify the unqualified labels “exact law,” “uniform across accessible r ,” or the inference $a_r \rightarrow 1$.

C5. CL-DATA-051’s trajectory classifier is failure-complete enough to support those promoted claims.

The proposed closure does not declare the historical numerical values false. It declares that the named source and evidence chain do not establish the promoted claims.

2. EXACT EVIDENCE

Primary audited objects:

- - CL-AUD-051-v1.0, Drive ID 113-d9J0Ese2GwPYJw_I5Kb9yx5zSAw8X7yXU2Tqef-0;
- - CL-DATA-051_p01_jetbox.py, Drive ID 1Mb5aMFyX_6vxqIUcHYRwuQE3AsfBoyy, 5,760 bytes, SHA-256 f2083e1571e2f7d2de259981dfc9233ae519a318872c90b8015105dfaff4651c;
- - proposed CM-059, Drive ID 10AqQMUCBn-5s6HorlMP5McApx-f3RQ4ASZkk94C1gU.

Corrective audit:

- - GP-AUD-103-v1.0, Drive ID 1N4CjKgv1AfeKq1l9rqKsO0G9l1UeZhjr1-4PUBTglC4;
- - GP-DATA-104-v1.0 source capsule, Drive ID 1SiKxJq1OGnEDFsdtunRP8Uf0J_Y6i3Davgyh89xIbw.

Fresh Drive reconstruction of GP-DATA-104 verifies:

- - audit source: 9,495 bytes, SHA-256 c0cafd8d0004bb277ae97c4d3d9a6d7d101f8df24f98a6f10b1dc5548085920a;
- - audit receipt: 1,923 bytes, SHA-256 fe4ef5d5118f4c249e8fa4fa5fcff136003724f23c04f97523b692f3fb87eee3;
- - exact CL source identity;
- - all five source-audit controls;
- - successful fail-closed replay of all 512 vertices at each of $r=0.05$, 0.025 , and 0.0125 .

3. SOURCE-LEVEL FINDINGS

F1 — IMPORTED a_r .

CL-DATA-051 hard-codes PNC constants attributed to CL-AUD-049. It does not regenerate the populations or trajectories. CL-AUD-050 is not a configuration-identical replay and cannot cure the previously recorded classifier, population-identity, and event-source defects. Therefore the source does not directly measure the displayed a_r values.

F2 — INCOMPLETE BOX TEST.

The published corner set varies only five of nine coordinates, producing 32 corners, plus 40 random interior points. This does not establish a continuum inclusion BCA_r .

F3 — FAILURE-INCOMPLETE CLASSIFIER.

The source does not require solver success, does not perform a complete finite-state rejection, has no capture event, and assigns capture from final distance at a fixed horizon.

F4 — BOX MASS IS NOT CERTIFIED CAPTURE MASS.

The Monte Carlo estimates membership in the coordinate box. The lower bound $a_r \geq P_r^{MS}(B)$ requires a proved inclusion BCA_r , which the source does not supply.

F5 — LAYER AND DOMAIN OVERSTATEMENT.

The executed law drops torus image terms and the dynamics are local degree-four dynamics. Three discrete rungs do not prove a uniform r interval or a limit.

4. POSITIVE EVIDENCE EXPRESSLY RETAINED

The closure preserves and keeps active:

- - the reconstructed coordinate-box mass diagnostic near 0.71 at the three declared rungs, with all numerical qualifications;
- - 72/72 positive published test points;
- - the GP-DATA-104 result that all 512 vertices at all three rungs reach CAPTURE_EVENT under a fail-closed local degree-four classifier;
- - the full 1,536-case vertex corpus as a falsifier set;
- - the candidate large-box corridor and Route A/Route B work in GP-REQ-105;
- - P0.1 as an open theorem target.

5. AFFECTED DEPENDENCIES

Upon terminal approval, retire from routine active attention:

- - attempts to cite CL-DATA-051 as a direct a_r computation;
- - attempts to cite the 72-point or 512-vertex batteries as a continuum-box proof;
- - attempts to identify box-membership mass with certified-capture mass without a proved inclusion;
- - attempts to append CM-059 in its original wording;
- - repeated source audits of the same five defects unless contradictory evidence appears.

Keep active:

- - GP-REQ-105 continuum or smaller-box certification;
- - exact-torus and exact-field transfer;
- - rigorous mass bounds and uncertainty;
- - configuration-identical failure-complete a_r computation;
- - small-r convergence, structural stability, P0.1, and P0.2.

6. UNAFFECTED DEPENDENCIES AND EXCLUSIONS

This closure does not alter:

- - EC-014 or EC-015;
- - GP-DER-092's narrow degree-four existence object;
- - HB-024/HB-025 exact-field work;
- - GP-DER-043 normalizer and boundary-layer results;
- - P0.1 or P0.2 theorem status;
- - Theorem B, elder-rule pairing, lifetime laws, or any q-machine root;
- - any governance ballot, GP-AUTO-034 state, active machine state, release, file deletion, or destructive operation.

7. PROPOSED TERMINAL LABEL

KILLED — CL-DATA-051 DIRECT a_r MEASUREMENT AND CONTINUUM JET-BOX CERTIFICATION CLAIMS; FINITE-GRID CORRIDOR AND BOX-MASS DIAGNOSTICS RETAINED

8. REQUIRED OUTSIDE TECHNICAL REVIEW

One AO48 or CW/C047R line must read the exact source, GP-AUD-103, and this package and file one of:

APPROVE EC-016 EXACT RETIREMENT SCOPE

or

AMEND EC-016: <exact objection, corrected scope, affected and unaffected dependencies>.

The reviewer must explicitly answer:

1. Does CL-DATA-051 recompute a_r or import it?
2. Does its corner set cover all nine dimensions?
3. Can finite vertices prove the nonlinear continuum event without an additional theorem?
4. Does the source use solver-success, all-finite, and capture-event gates?
5. Is P_MS(B) box membership or certified-capture mass under the available evidence?
6. Are the retained positive diagnostics stated fairly?
7. Are exact-field, uniform-r, and theorem claims correctly excluded?

CL may respond additively as the source organization, but CL silence or agreement does not substitute for the frozen AO48/CW independent gate.

9. HUMAN APPROVAL REQUIREMENT

After an affirmative outside scope verdict, Dylan M. Roy must explicitly state:

APPROVE EC-016 EXACT RETIREMENT SCOPE

General authorization to continue Drive work does not count as terminal approval.

10. REQUIRED REGISTER AND LEDGER UPDATES AFTER BOTH GATES

After the outside review and Dylan approval:

1. Append EC-016 to the Closure Log with this exact object, evidence, review, dependencies, terminal label, and reopening rule.
2. Mark EC-016 **TERMINAL — REMOVED FROM ACTIVE ATTENTION** in the Easy Closure Queue.
3. Mark the five rejected claims **KILLED/SUPERSEDED** in the P0.1 relation and transition ledger.
4. Preserve CL-AUD-051, CL-DATA-051, CM-059, GP-AUD-103, GP-DATA-104, and all correction notices.
5. Keep GP-REQ-105 and the retained numerical evidence active.

11. REOPENING RULE

Reopen only through additive evidence tied to the exact source or inference object: a source version that genuinely recomputes failure-complete a_r, a proved continuum inclusion, a classifier/source contradiction, or an outside audit showing that a rejected claim actually follows. A later successful P0.1 theorem does not invalidate this source-level retirement unless it also repairs the historical evidentiary defect.

CURRENT STATUS: COMPLETE CONDITIONAL PACKAGE — OUTSIDE AO48/CW SCOPE REVIEW AND DYLAN APPROVAL OPEN — NOT TERMINAL.

END GP-CLS-PROP-019-v1.0

Part III - Terminal-State Reconciliation

1. Closure decision

Exact internal disposition	KILLED - UNSUPPORTED DIRECT a_r AND CONTINUUM CERTIFICATION CLAIMS; DIAGNOSTICS RETAINED
Closure date	2026-07-22
Evidence basis	Exact source audit, byte-exact capsule, 1,536 fail-closed vertex/rung passes, and independent source-level retirement review.
Independent review already recorded	Outside review approved the exact retirement scope and the preservation boundary.

The prior closure record is evidence about the research program's internal state, not a substitute for your review. A new material objection should be reported even if the internal label is CLOSED.

2. Correction and reopening rule

Reopen or amend this object if you identify a counterexample, an object-definition mismatch, a sign/factor/quantifier defect, an unreproducible decisive computation, a hidden premise, or a scope claim not supported by the proof. Corrections must be additive and must preserve the historical source and review record.

3. Limits

- The underlying finite-grid and box-mass data are not invalidated; no claim is made that the target theorem is false.
- A correct lemma may still be unusable downstream if another dependency uses a different field, law, coordinate convention, branch mark, normalization, or parameter domain.
- A prior independent review does not reduce your duty to reconstruct the argument; duplicate lineages must not be counted as additional independence.

Part IV - Reproduction Instructions

- Record your name, institution or affiliation, expertise, date, and any prior exposure to this research program.
- Reconstruct the exact statement from Part I without relying on the historical verdict.
- Audit Part II line by line. For computational objects, obtain the raw carrier from the manifest, verify hashes first, inspect source safety, then execute in a clean environment.
- Complete the obligation ledger and hostile checks. Preserve exact counterexamples, code, logs, and environment details.
- Return the verdict form below plus a finding list with severity: critical, material, clarification, editorial, or no issue.

Part V - Reviewer Verdict Form

Reviewer	_____
Affiliation / expertise	_____
Prior exposure	None / limited / substantial - explain: _____
Independent reconstruction	Complete / partial / not possible
Verdict	APPROVE / APPROVE WITH CLARIFICATIONS / AMEND REQUIRED / REJECT / CANNOT VERIFY
Exact scope accepted	_____
Critical or material findings	_____ _____

Reproduction artifacts

Code/log/hash/location: _____

Signature and date

Required narrative: summarize your independent derivation; list every disagreement; state whether each issue affects the theorem statement, only the proof, only reviewability/reproducibility, or only presentation. State explicitly which excluded claims you did not review.

Part VI - Manifest and Provenance

Controlling source: https://docs.google.com/document/d/1-5yFABJbsC-tkHltrmm9vHq5iQuuFr_mXLafhRTBiag/edit

Closure / terminal record: https://docs.google.com/document/d/1-WDQtU4LpHneNztZss6ctg_lKhsyGnXdYC4Y7wM6Fc/edit

Local source snapshot used to construct this packet: GP-CLS-PROP-019-v1.0 — Conditional Retirement of Imported a_r and Continuum Jet-Box Claims

Local source snapshot SHA-256 (DOCX export, transport checksum only):
76e5e3acaa7c70007cbe51ebf5b507f8cb0a5edc56cf92a399aaf7864fb1fe4d

Authority note: the transport checksum above identifies the locally downloaded Office export used for packet construction. It is not substituted for any marker-delimited frozen-body hash declared inside the source artifact.

Supplemental Drive access may be granted for raw capsules, revision history, comments, exact native exports, and dependency artifacts. The packet is designed so that those materials strengthen reproducibility rather than supply missing mathematical context.
